# Appendix B

## MODEL VERIFICATION

The comparison of modelled concentrations with local monitored concentrations is a process termed 'verification'. Model verification investigates the discrepancies between modelled and measured concentrations, which can arise due to the presence of inaccuracies and/or uncertainties in model input data, modelling and monitoring data assumptions. The following are examples of potential causes of such discrepancy:

- a) estimates of background pollutant concentrations;
- b) meteorological data uncertainties;
- c) traffic data uncertainties;
- d) model input parameters, such as surface roughness; and
- e) overall limitations of the dispersion model.

## NITROGEN DIOXIDE

In line with the guidance provided within LAQM.TG(22), the ADMS-Roads model output has been verified in terms of the primary emissions of NO<sub>x</sub> produced by road traffic. Bias adjusted annual mean NO<sub>2</sub> concentrations for 2019 as recorded by LBE and Epping Forest District Council<sup>1</sup> have been used for verification.

The model has been run to predict the 2019 annual mean road-NO<sub>x</sub> contribution at several diffusion tubes within the modelled road network. The model outputs of road-NO<sub>x</sub> have been compared with the 'measured' road-NO<sub>x</sub>, which was determined from the NO<sub>2</sub> concentrations measured using diffusion tubes at the monitoring locations, utilising the NO<sub>x</sub> from NO<sub>2</sub> calculator provided by Defra and the NO<sub>2</sub> background concentration (from the 1km x 1km Defra background maps).

The table and figure below present the data used in the verification.

**Table B-1 – Comparison of monitored and modelled total annual mean NO<sub>2</sub> concentrations (µg/m<sup>3</sup>) before any adjustment**

The road-NO<sub>x</sub> adjustment factor of **1.7161** is the slope of the best fit line between the 'measured' road contribution and the model derived road contribution, forced through zero (**Figure B-2**). This factor was applied to the modelled road-NO<sub>x</sub> concentration for each monitoring site to provide adjusted modelled road-NO<sub>x</sub> concentrations.

**Figure B-2: Comparison of measured road-NO<sub>x</sub> with unadjusted modelled road-NO<sub>x</sub>**

**Table B-7: Uncertainty statistics after adjustment**

Uncertainty statistics	Value
Root Mean Square Error	5.5µg/m <sup>3</sup>
Fractional Bias	0.003

Adjustment resulted in a better fit of modelled concentrations with those from monitoring. The smaller FB value indicates that the adjusted model tends to only slightly underpredict concentrations compared to the unadjusted model. The RMSE of 5.5µg/m<sup>3</sup>, which is 13.75% of the standard (previously 21.25%).

### **PM<sub>10</sub> AND PM<sub>2.5</sub>**

There are no local PM<sub>2.5</sub> monitoring data against which the model could be verified and local PM<sub>10</sub> monitoring is only undertaken at one location and so the spatial coverage is not sufficient for use in verification. Consequently, the verification factor determined above for adjusting the road-NO<sub>x</sub> contribution has been applied to the predicted road-PM<sub>10</sub> and road-PM<sub>2.5</sub> contributions, consistent with guidance set out in LAQM.TG(22).
